

RECEPTACLES TO FACILITATE THE EXTRACTION OF POWDERS

ABSTRACT OF THE DISCLOSURE

A receptacle for holding fine powders comprises a receptacle body that defines an enclosed cavity. The receptacle body has a top end and a bottom end. Further, the bottom end of the receptacle body includes a raised central region that extends upwardly into the cavity. In this way, the flow of air through the cavity will remain generally adjacent the walls of the cavity until exiting through an extraction tube.
